Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

1. (Currently amended) A processor, the processor implemented as a three way super scaler, pipelined architecture, the processor comprising:

an out-of-order microinstruction pointer (µIP) stack for storing pointers in a microcode (µcode) execution core, the pointers placed on the out-of order microinstruction pointer stack and removed from the microinstruction pointer stack before it is known if a sequence of microinstructions pointed to by the pointers is valid.

- 2. (Previously presented) The processor of claim 1 in which entries in the μ IP stack comprise:
 - an entry number field;
 - a microinstruction pointer (µIP) field;
 - a back pointer field;
 - a retirement indicator field; and
 - a return pointer field.
- 3. (Original) The processor of claim 2 in which the μ IP field is 14-bits wide.
- 4. (Original) The processor of claim 3 in which the μ IP field has a microinstruction pointer (μ IP) pushed by a first microoperation (μ Op) code and used by a second μ Op code.
- 5. (Original) The processor of claim 2 in which the back pointer field has a pointer to a next entry in the μ IP stack for a micro-type of service (μ TOS) bit to point to after a μ Op.

Serial No.: 10/032,154

Filed: December 20, 2001

6. (Original) The processor of claim 2 in which the retirement indicator field has an indication of whether an entry has retired.

- 7. (Original) The processor of claim 2 in the return pointer field a pointer to a location in a retirement stack to which an entry is copied after being retired.
- 8. (Currently amended) A method executed in a processor, the processor implemented as a three way super scaler, pipelined architecture, the method comprising:

executing microcode (μ code) addressed by pointers stored in an out-of-order microinstruction pointer (μ IP) stack, the pointers placed on the out-of order microinstruction pointer stack and removed from the microinstruction pointer stack before it is known if a sequence of microinstructions pointed to by the pointers is valid; and

manipulating the µIP stack with a set of microinstructions.

- 9. (Previously presented) The method of claim 8 in which entries in the stack have an entry number field, a microinstruction pointer (µIP) field, a back pointer field, a retirement indicator field and a return pointer field.
- 10. (Original) The method of claim 9 in which the μIP pointer field is 14-bits wide.
- 11. (Original) The method of claim 10 in which the μ IP pointer field has a microinstruction pointer (μ IP) pushed by a first microoperation (μ Op) code and used by a second μ Op code.
- 12. (Original) The method of claim 9 in which the back pointer field has a pointer to a next entry in the μ IP stack for a micro-type of service (μ TOS) bit to point to after a μ Op.

13. (Original) The method of claim 9 in which the retirement indicator field has an indication of whether an entry has retired.

- 14. (Original) The method of claim 9 in which the return pointer field contains a pointer to a location in a retirement stack to which an entry is copied after being retired.
- 15. (Original) The method of claim 9 in which manipulating comprises: pushing a next μIP on to the μIP stack; and using the next μIP in an intermediate field as a target μIP in a jump operation.
- 16. (Original) The method of claim 9 in which manipulating comprises: taking a value of an intermediate field of a microoperation (μ Op); and pushing the value on to the μ IP stack.
- 17. (Original) The method of claim 9 in which manipulating comprises: popping a value off the μIP stack; and replacing a current μOp intermediate field.
- 18. (Original) The method of claim 9 in which manipulating comprises: popping a value off of the μIP stack; and jumping to that value.
- 19. (Original) The method of claim 9 in which manipulating comprises: reading a value off the μIP stack; and replacing a μOp's intermediate field with the value.
- 20. (Original) The method of claim 9 in which manipulating comprises setting the μ IP stack pointers to reset.

21. (Original) The method of claim 9 further comprising providing a set of pointers that point to

different entries in the μ IP stack.

22. (Original) The method of claim 21 in which the set of pointers includes a μ TOS pointer that

points to a top of the μ IP stack.

23. (Original) The method of claim 21 in which the set of pointers includes a µAlloc pointer that

points to a next allocated entry in the μ IP stack.

24. (Original) The method of claim 21 in which the set of pointers includes a NextRet pointer

that points to a next entry in the μ IP stack to be deallocated.

25. (Original) The method of claim 21 in which the set of pointers includes µRetTos pointer that

points at a retired top of the μ IP stack.

26. (Original) The method of claim 8 in which the μOPs include an ms call μOP that takes a

next μIP , pushes the next μIP on the μIP stack, and uses the next μIP in an intermediate field as a

target µIP of a jump.

27. (Original) The method of claim 8 in which the μOPs include an ms push μOP that takes a

value in an intermediate field and pushes the value on the μ IP stack.

28. (Original) The method of claim 8 in which the μOPs include an ms_pop μOP that pops a

value off the μIP stack and replaces the value with the μOP's intermediate field.

29. (Original) The method of claim 8 in which the μOPs include an ms_return μOP that pops a

value off of the μ IP stack and jumps to that μ IP.

30. (Original) The method of claim 8 in which the μ OPs include an ms_tos_read μ OP that reads a value off the μ IP stack and replaces this μ OP's intermediate field.

- 31. (Original) The method of claim 8 in which the μ OPs include an ms_ μ ip_stack_clear μ OP that sets the μ IP stack pointers to reset.
- 32. (Currently amended) A computer program product residing on a computer readable medium having instructions stored thereon which, when executed by the processor, cause the processor to:

execute microcode (µcode) addressed through pointers stored in an out-of-order microinstruction pointer (µIP) stack, the pointers placed on the out-of order microinstruction pointer stack and removed from the microinstruction pointer stack before it is known if a sequence of microinstructions pointed to by the pointers is valid; and

manipulate the μIP stack with a set of microinstructions.

33. (Original) The computer program product of claim 32 wherein instructions to manipulate further comprise instructions to:

push a next μ IP on to the μ IP stack; and use the next μ IP in an intermediate field as a target μ IP in a jump operation.

34. (Original) The computer program product of claim 32 wherein instructions to manipulate further comprise instructions to:

take a value of an intermediate field of a microoperation (μ Op); and push the value on to the μ IP stack.

35. (Original) The computer program product of claim 32 wherein instructions to manipulate further comprise instructions to:

Serial No.: 10/032,154

Page : 7 of 9

pop a value off the μ IP stack; and replace a current μ Op intermediate field with the value.

36. (Original) The computer program product of claim 32 wherein instructions to manipulate further comprise instructions to:

pop a value off of the μIP stack; and jump to that value.

37. (Original) The computer program product of claim 32 wherein instructions to manipulate further comprise instructions to:

read a value off the μIP stack; and replace a μOp 's intermediate field with the value.

38. (Original) The computer program product of claim 32 wherein instructions to manipulate further comprise instructions to:

set the µIP stack pointers to reset.
